

Task 5: Creating Creation Command Class

In order to initialise the UML diagram in your UML profile editor, a Creation Command class is needed to perform the initialisation of the model. You are therefore required by Papyrus to create a subclass of

```
org.eclipse.papyrus.uml.diagram.common.commands.ModelCreationCommandBase;
```

that implements

```
org.eclipse.papyrus.infra.architecture.commands.IModelCreationCommand;
```

To create your own Creation Command.

You need to override the `CreateRootElement()` and the `initializeModel()` methods in order to register your own UML profile, and create the root element of the diagram. This is typically a difficult task, however, there are some hints provided in the Papyrus forum which can be found [here](#).

Note: you have 30 minutes to complete this task.
