

Task 4: Creating Custom Styles

Papyrus enables the users to custom the graphical representations of their Stereotypes in their UML profile editors via the usage of Cascading Style Sheet (CSS). There is a very detailed tutorial on how to do this in [\[1\]](#).

For each of the Stereotypes you defined in your UML profile, assign them with the image shapes (.svg files) that have been provided to you.

Tasks:

- 1. Define the custom style for an arbitrary Stereotype that extends the Class meta-element.**
- 2. Change the font of the Stereotype that extends the Class meta-element (For the Webpage profile, make the font bold; for the FTA profile, make the font bold and set its size to 18pt).**
- 3. Define the custom style for an arbitrary Stereotype that extends the Association meta-element (change the line style to dotted).**
- 4. If you find no problems with the previous tasks, define the custom style for all Stereotypes.**

Note: You have 30 minutes to complete this task.
